

Current Project Data Flow Diagram

Based strictly on the active Vite/React codebase in src/

System Flow Summary

The portal routes users through authentication, healthcare discovery, support, dashboard, notifications, and content pages. Hospitals and doctors are served from local datasets inside the repository, while user profiles, favorites, support tickets, and notifications are persisted in Firebase. CuraNex is stored only in browser localStorage and does not currently sync to Firestore.

Entities

- User / Visitor
- Authenticated User
- Firebase Authentication
- Identity Providers
- Phone Verification / reCAPTCHA
- Firestore Database
- Support Team

Processes

- P1 Session Initialization
- P2 Authentication
- P3 Hospital Search
- P4 Doctor Search
- P5 Favorites
- P6 Support Requests
- P7 Notifications
- P8 Dashboard
- P9 CuraNex Feed
- P10 Static Content
- P11 Dataset Enrichment

Data Stores

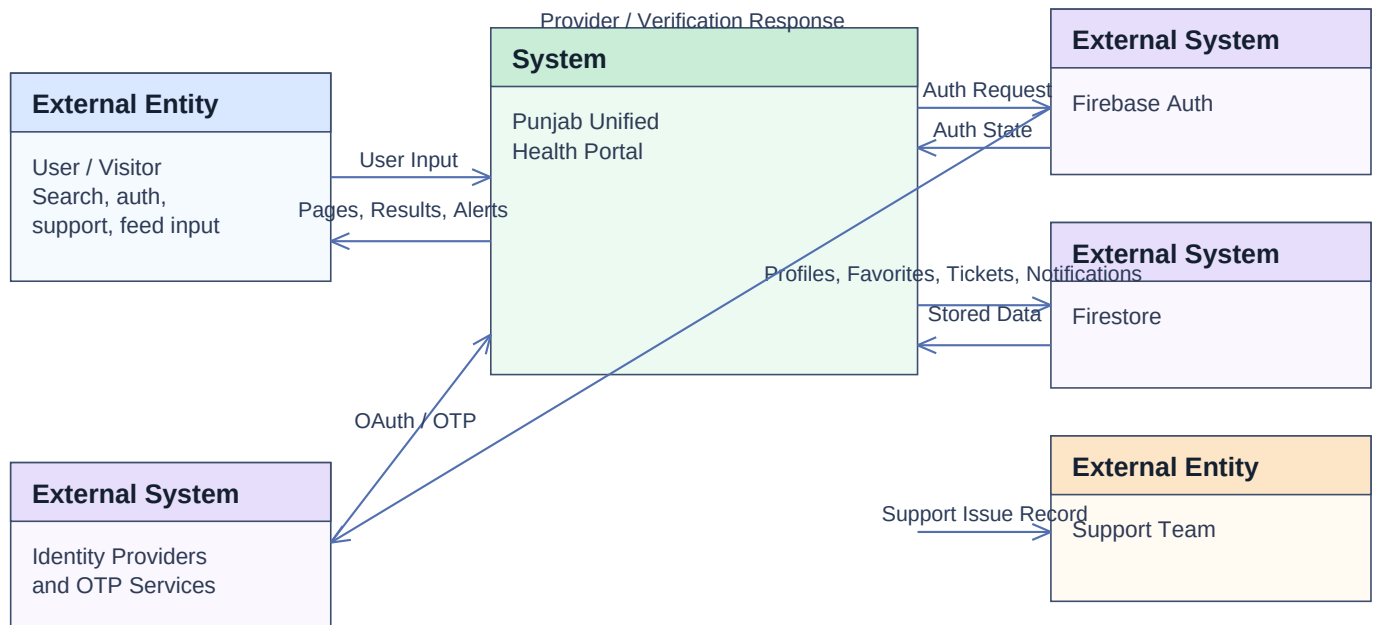

- D1 Auth Session Persistence
- D2 users
- D3 userFavorites
- D4 support_requests
- D5 notifications
- D6 Local Datasets
- D7 localStorage

Mermaid Source Included In docs/dfd-report.md

- User Input -> Auth, Search, Filters, Support Form, Feed Actions
- Processed Data -> Filtered doctor and hospital results
- Favorite Toggle -> Firestore userFavorites collection
- Support Ticket -> support_requests with notification side-write
- Alert -> Navbar notifications snapshot and toast updates
- Local Social State -> CuraNex posts and theme in localStorage

Level 0 DFD

Context diagram for the Punjab Unified Health Portal

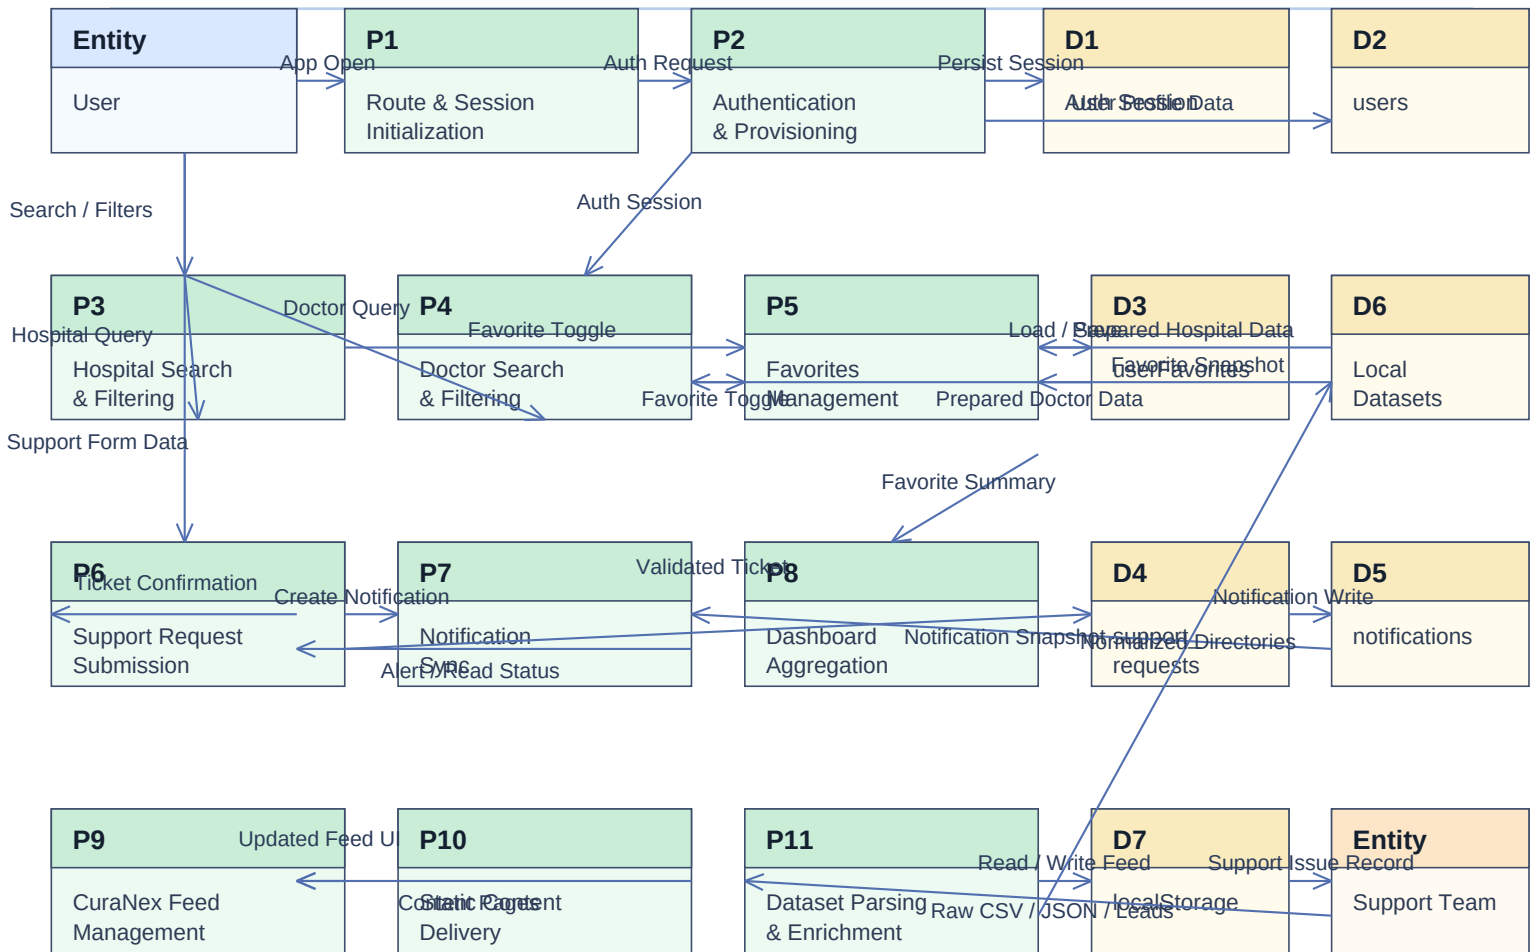

Flow Labels

- User Input: search queries, credentials, OTP, support form, post content
- Pages, Results, Alerts: rendered UI, ticket IDs, filtered data, favorites, notifications
- Auth Request / Auth State: Firebase session lifecycle and identity verification
- Profiles, Favorites, Tickets, Notifications: all Firestore read/write traffic
- Support Issue Record: operational ticket data for follow-up

Level 1 DFD

Detailed processes, stores, and data movement in the current app

Highlighted Flows

- User Input: credentials, OTP, search query, filters, support form, post actions
- Processed Data: filtered directory results, dashboard favorites, rendered content pages
- Alert: ticket confirmation, notification toast, dropdown items, auth errors
- Prepared Dataset: doctors and hospitals derived from CSV, leads, and raw JSON files
- Server-side Persistence: Firestore users, userFavorites, support_requests, notifications
- Browser-only Persistence: Firebase auth persistence and CuraNex localStorage
